ANSWER ANY FIVE (5) QUESTIONS

*TIME ALLOWED: 3 HRS*

*TOTAL MARKS : 100*

---

**Question One**

Two race cars start from rest at the same time. Acceleration of car A is given by  $30e^{-t/5} \text{ m/s}^2$  and that of car B is given by  $20e^{-t/5} \text{ m/s}^2$

- (a) Determine the distance at which car B overtakes car A . [10]
- (b) Also determine their relative velocity at that time. [10]

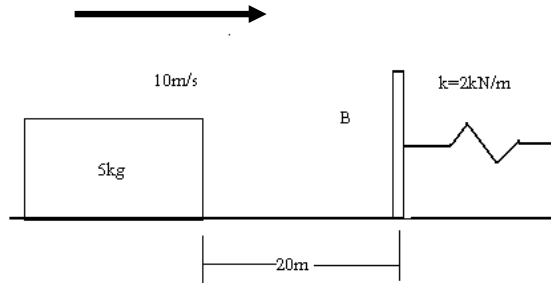

**Question two**

The total linear momentum of a system of three particles at time  $t = 5s$  is given by  $G_{2,2} = 4i - 6j + 6k \text{ kg.m/s}$ . At time  $t = 8s$ , the linear momentum has changed to  $G_{2,4} = 3i - .2j + 4k \text{ kg.m/s}$ . Calculate the magnitude F of the time average of the resultant of the external forces acting on the system during the interval. [20]

**Question three**

For the figure shown below the 5kg block slides along a horizontal floor and strikes bumper B. The coefficient of friction between the block and the floor is  $\mu_k = 0.3$ , and the mass of the bumper is 2kg. If the speed of the block is 10m/s when it is 20 m from the bumper, determine:

- (a) the speed  $v$  of the block at the instant it strikes the bumper [10]
- (b) The maximum deflection of the spring due to the motion of the block. [10]

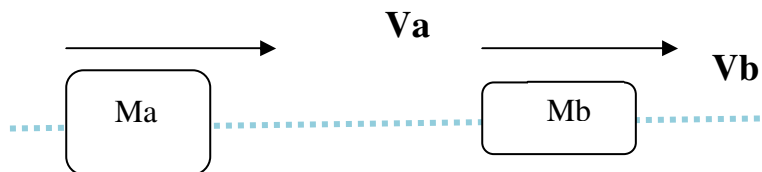

### Question four

The bars shown in figure Q4 are sliding freely on a horizontal rod.. For the conditions specified in table Q4, determine:

- The final velocity of both beads. [8]
- The percentage of the initial kinetic energy lost as a result of the collision of the two bars. [6]
- The average interaction force between the beads if the duration of impact is 0.001s. [6]

**Table Q4**

| $m_A$ | $v_A$ | $m_B$ | $v_B$ | $e$ |
|-------|-------|-------|-------|-----|
| 9kg   | 3m/s  | 2kg   | 0m/s  | 0.3 |

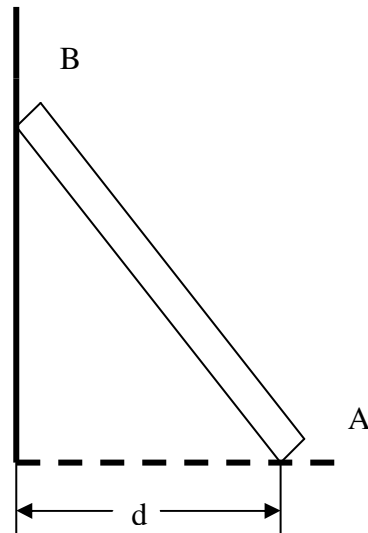

**Figure Q4**

### Question five

- Mention the applications of friction where there is need to minimize it and some where these effects are essential. [6]

(b) Distinguish between the coefficient of static friction and the coefficient of kinetic friction. [4]

© The uniform pole shown in figure Q5 has a weight of 2kN and a length of 15m. Determine the maximum distance  $d$  it can be placed from the smooth wall and not slip. The coefficient of static friction between the floor and the pole is  $\mu_s = 0.32$

**Figure Q5**

**Question six**

- (a) Determine the centroidal coordinates of the trapezoidal area shown in figure Q6. [10]
- (b) Also determine the moment of inertia of the composite body about the X and the Y axis. [10]
