# NATIONAL UNIVERSITY OF SCIENCE AND TECHNOLOGY FACULTY OF INDUSTRIAL TECHNOLOGY <br> DEPARTMENT OF CIVIL AND WATER ENGINEERING <br> BACHELOR OF ENGINEERING (HONOURS) DEGREE <br> PART III SECOND SEMESTER EXAMINATIONS APRIL/MAY 2006 IRRIGATION SYSTEMS DESIGN TCW 3204 

## INSTRUCTIONS

Answer any four questions.
Illustrate your answers with clearly well labeled diagrams
were applicable.
Total Marks 100
Time 3 hours

## QUESTION 1

(a) Differentiate between soil moisture tension and soil water potential
(b) "Irrigation is a systematically developed knowledge, based on long term observations and experiments of handling available sources of water for economic growth." Discuss.
[20 marks]

## QUESTION 2

2(a) Define the following terms:
(ii) Field capacity
[2 marks]
(iii) Osmotic potential
[2 marks]
(b) A schematic illustration to measure the soil hydraulic conductivity is shown in Fig. Q2.1. The constant discharge through the system is $0.021 \mathrm{~m}^{3} / \mathrm{min}$.
Compute:
(i) Pressure potential [3 marks]
(ii) Hydraulic conductivity of the soil sample [3 marks]
(iii) Establish the direction of flow [3 marks]
(c) The filtration capacity of a soil is given in Table Q2.1 and also the following design parameters are applicable to a maize crop:

| Root zone | $=1000 \mathrm{~mm}$ |
| :--- | :--- |
| Field capacity | $=35 \%$ |
| Permanent wilting point | $=15 \%$ |
| Allowable level of moisture depletion | $=60 \%$ |
| Distribution pattern efficiency | $=87 \%$ |

(i) Derive a fitting equation for the infiltration data.
(ii) Compute the irrigation interval
(iii) Determine the time of irrigation to apply the net depth

Table Q2.1

| Time <br> $(\mathrm{min})$ | 2 | 3.6 | 6.4 | 11.2 | 20 | 36 | 64 | 113 | 200 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Depth of infiltration <br> $(\mathrm{mm})$ | 0.5 | 0.7 | 1.0 | 1.5 | 2 | 3.1 | 4.6 | 6.5 | 9.8 |

Fig. Q2.1

## QUESTION 3

Using the FAO Modified Penman's equation, determine the $E T_{\text {crop }}$ given the following design parameters. Additional design data is in Table Q3.1 and Table Q3.2.
Average design wind speed at height of 10.5 m
Minimum temperature

$$
=10 \mathrm{~km} / \mathrm{hr}
$$

Maximum temperature
$=15^{\circ} \mathrm{C}$
Maximum relative humidity
Minimum relative humidity
Incoming short wave radiation
Outgoing long wave radiation
Coefficient of albedo
Altitude above sea level
$=28^{\circ} \mathrm{C}$
Day time wind speed
Night wind speed
Crop coefficient
=45\%
$=3 \mathrm{~cm} /$ day
$=1.5 \mathrm{~cm} /$ day
$=0.25$
$=2050 \mathrm{~m}$
$=300 \mathrm{~km} / \mathrm{day}$
$=155 \mathrm{~km} /$ day
$=1.02$
[11 marks]
(b) A two sized lateral line has 12 sprinklers on the first section and 6 sprinklers on the second section. Each sprinkler on the first section has a discharge of $0.95 \mathrm{~L} / \mathrm{s}$, whilst those on the second section, each sprinkler has a discharge of $0.78 \mathrm{~L} / \mathrm{s}$. On the first section, the first sprinkler is located at one-half the sprinkler spacing and on the second section, the first
sprinkler is at full spacing. The remaining sprinklers are all spaced at 12 m , and the respective diameters are of the two sections are 120 mm and 90 mm . The lateral is downhill at a slope of 0.0045 . Compute the friction head losses in the lateral. Assume $\mathrm{C}=135$; $\mathrm{m}=1.852 ; \mathrm{n}=1.167$ and $\mathrm{K}=1.22 \times 10^{2}$.
[14 marks]

## QUESTION 4

(a) The following design parameters are applicable to the design of a level border.

Additional design data is given in Table Q4.1.

| Manning's roughness coefficient | $=0.15$ |
| :--- | :--- |
| Slope | $=0.003$ |
| Net depth of application | $=105 \mathrm{~mm}$ |
| Distribution pattern efficiency | $=0.85$ |
| Application pattern efficiency | $=100 \%$ |
| Length of border | $=300 \mathrm{~m}$ |
| Intake family coefficients | $a=1.13$ |
|  | $b=0.742$ |
|  | $c=7$ |

Compute: (i) Net opportunity time
(i) Recession lag time
(ii) Time to cut flow
(iii) Depth of water in the border
(b) With aid of a sketch describe the time-distance relationships of water during application and infiltration into the soil for surface irrigation.

## QUESTION 5

(a) A lateral line running up-hill at a slope of 0.006 has an operating pressure of 250 kPa . The distance between the first and the last sprinkler on the lateral is 550 m . The sprinklers as spaced at 18 m and the first sprinkler is at half the spacing and all the sprinklers have a discharge of 0.45 liters per second. Assuming $C=135 ; m=1.852$ and $\mathrm{n}=1.167$, compute:
(i) Maximum allowable friction head loss
(ii) Pipe line diameter
[7 marks]
(b) FAO Modified Penman's method is now recommended as the standard method for the definition and computation of the reference evapotranspiration. Discuss. [15 marks]

## QUESTION 6

(a) Determine the length of an emitter and also the approximate length of the lateral given the following design criteria:

Plant water requirement Irrigation cycle
Application efficiency
Number of emitters per plant
Emitter operation pressure head
Inside diameter of emitter
Kinematic viscosity of water
Lateral diameter
$=10$ liters per day
$=12$ hrs after every 7 days
=92\%
$=2$
$=10 \mathrm{~m}$
$=1 \mathrm{~mm}$
$=1.0 \times 10^{-6} \mathrm{~m}^{2} / \mathrm{s}$
$=15 \mathrm{~mm}$

| Hazen Williams coefficient | $=130$ |
| :--- | :--- |
| Emitter flow function | $=0.72\left[\frac{P}{\gamma}\right]^{0.81}$ |
| Desired coefficient of uniformity | $=91 \%$ |
| Proportionality factor that characterizes flow regime | $=2.6$ |
| Ground slope (lateral sloping up-hill) | $=0.4 \%$ |
| Emitter flow variation for the desired CU | $=15 \%$ |

[13 marks]
(b) The various layouts for sprinkler irrigation are shown in Fig. Q6.1. Outline the various factors which govern or affect each system.
[12 marks]

## Useful formulae

$$
\begin{aligned}
& H_{f}=\frac{K\left(\frac{Q_{1}}{C}\right)^{1.852}}{D_{1}^{4.87}} E T_{o}=c\left[\left(\frac{\Delta}{\Delta+\gamma}\right) R_{n}+\frac{\gamma}{\Delta+\gamma} f(u) \Delta e\right] h_{f}=6.377 f L \frac{Q^{2}}{D^{5}} \\
& P_{o}=\left(\frac{P_{o}}{P_{n}}\right) \gamma\left[\frac{q_{n}}{K_{e}}\left(2-\frac{q_{o}}{q_{n}}\right)\right]^{\frac{1}{x}} L_{u}=\frac{6 \times 10^{4}\left(Q_{u} T_{t}\right)}{a \frac{\left(T_{t}\right)^{b}}{1+b}+c+1798 n^{3 / 8} Q_{u}^{9 / 16} T_{t}^{3 / 16}} F=\frac{1}{m+1}+\frac{1}{2 N}+\frac{(m-1)^{0.5}}{6 N^{2}} \\
& F=\frac{2}{2 N-1}\left\{\frac{1}{m+n}+\frac{\left(m-1^{0.5}\right)}{6 N^{2}}\right\} T_{r l}=\frac{\left(Q_{u}\right)^{0.2} n^{1.2}}{120\left[S+\frac{0.0094 n Q_{u}^{0.175}}{T_{n}^{0.88} S^{0.5}}\right]^{1.6} \quad Q=\frac{0.00167 i_{n} L}{\left(T_{n}-T_{r j}\right) e_{d} e_{a}}} \\
& E T_{o}=\frac{\Delta}{\Delta+\gamma}\left(R_{n}-G\right)+\frac{\gamma}{\gamma+\Delta} f(u) \Delta e \quad q=0.11384(A)\left[2 g\left(\frac{\sqrt{H} D}{f L}\right)\right]^{0.5} \\
& q=0.11384 A\left(2 g\left(\frac{H D}{f L}\right)\right]^{0.5} \quad E T_{o}=c\left[\omega R_{n}++(1-\omega) f(u)\left(e_{s}-e_{a}\right)\right] \\
& e_{s}=6.1078 e^{x}, \mathrm{mb} \\
& x=\frac{19.8374 T_{\text {mean }}-0.00831 T_{\text {mean }}^{2}}{T_{\text {mean }}+273.16} \quad f=3.42 \times 10^{-5} R_{e}^{0.85} \quad \gamma=\frac{e_{s}-e_{a}}{T_{d r y}-T_{w e t}} f=\frac{64}{R_{e}} \\
& \Delta=2\left[0.00738 T_{\text {nean }}+0.8072\right]^{7}-0.00116 \\
& H_{f}=H_{f}\left(L_{1}+L_{2}, D_{1}\right)-H_{f}\left(L_{2}, D_{1}\right)+H_{f}\left(L_{2}, D_{2}\right)=H_{f}^{0.25}\left(L_{1}, D_{1}\right)+H_{f}\left(L_{2}, D_{2}\right) \\
& 1 \\
& \sqrt{f}
\end{aligned}
$$
