# NATIONAL UNIVERSITY OF SCIENCE AND TECHNOLOGY <br> FACULTY OF INDUSTRIAL TECHNOLOGY <br> INDUSTRIAL AND MANUFACTURING ENGINEERING DEPARTMENT <br> SECOND SEMESTER EXAMINATION - AUGUST/SEPTEMBER 2009 <br> SOLID MECHANICS II <br> COURSE CODE TIE 2203 

Examination duration 3 hours
INSTRUCTIONS TO CANDIDATE
Answer any FIVE questions out of seven.
Show all working
All Questions carry equal marks (20)

## Additional Material

Table 1.1 Table of $\mathrm{k}_{1}$ and $\mathrm{k}_{2}$ values for rectangular sections in Torsion ${ }^{[1]}$

| $\mathrm{d} / \mathrm{b}$ | 1.0 | 1.5 | 1.75 | 2.0 | 2.5 | 3.0 | 4.0 | 6.0 | 8.0 | 10.0 | Infinity |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathrm{k}_{1}$ | 0.208 | 0.231 | 0.239 | 0.246 | 0.258 | 0.267 | 0.282 | 0.99 | 0.307 | 0.313 | 0.333 |
| $\mathrm{k}_{2}$ | 0.141 | 0.196 | 0.214 | 0.229 | 0.249 | 0.263 | 0.281 | 0.299 | 0.307 | 0.313 | 0.333 |

## Question One

At a point in a material the direct stresses are $40 \mathrm{MN} / \mathrm{m}^{2}$ (tensile) and $60 \mathrm{MN} / \mathrm{m}^{2}$ (tensile) in mutually perpendicular directions. On the planes carrying the applied direct stresses, there also acts an applied shear stress of value $30 \mathrm{MN} / \mathrm{m}^{2}$.
(a) From first principles derive the equations for the direct stress and shear stresses on the plane, assuming unit area.
(b) Calculate, relative to the direction of the $40 \mathrm{MN} / \mathrm{m}^{2}$ stress;
(i) the angles of the principal planes
(ii) the values of the principal stresses

## Question Two

In a certain material under load a plane AB carries a tensile direct stress of $30 \mathrm{MN} / \mathrm{m}^{2}$ and a shear stress of $20 \mathrm{MN} / \mathrm{m}^{2}$, while another plane BC carries a tensile direct stress of $20 \mathrm{MN} / \mathrm{m}^{2}$ and a shear stress. If the planes are inclined to one another at $30^{\circ}$ and plane AC at right angles to plane AB carries a direct stress unknown in magnitude and nature, compute:
(i) the value of the shear stress on BC,
(ii) the magnitude and nature of the direct stress on AC ,
(iii) the principal stresses

## Question Three

A thick cylinder of external diameter 100 mm and 50 mm internal diameter is wound with steel wire of 1 mm diameter, initially stressed to $20 \mathrm{MN} / \mathrm{m}^{2}$ until the outside diameter is 120 mm . Determine the maximum hoop stress set up in the cylinder if an internal pressure of $30 \mathrm{MN} / \mathrm{m}^{2}$ is now applied.

## Question Four

A thick walled pressure vessel has internal and external radii, respectively, 100 mm and 150 mm . It is subjected to an internal pressure of $60 \mathrm{MN} / \mathrm{m}^{2}$ and an external pressure of $30 \mathrm{MN} / \mathrm{m}^{2}$. Determine;
(a) the hoop stress,
(b) the radial stresses, at the inside and outside of the vessel;
(c) the longitudinal stress if the cylinder is assumed to have closed ends.

## Question Five

A cantilever beam 2.6 m long, is of rectangular cross-section $160 \mathrm{~mm} \times 100 \mathrm{~mm}$, and is loaded at its free end with a load of 10 kN inclined at an angle of $30^{\circ}$ to the vertical as shown in figure Q5 below. Determine;
(i) the position of the greatest tensile stress in the section.
(ii) the magnitude of the greatest tensile stress in the section.
(iii) What will be the vertical deflection at the end?

Consider E $=210 \mathrm{GN} / \mathrm{m}^{2}$

Figure Q5

## Question Six

A horizontal strut 4 m long is constructed from rectangular section steel, 80 mm wide by 100 mm deep and is mounted with pinned ends. The structure carries an axial load of 240 kN together with a uniformly distributed load of $10 \mathrm{kN} / \mathrm{m}$ on its full length.
If $\mathrm{E}=200 \mathrm{GN} / \mathrm{m}^{2}$;
(a) determine the maximum stress set up in the strut,
(b) check the result using the approximate Perry method with $M_{\max }=M_{0}\left[\frac{P_{e}}{P_{e}-P}\right]$, [10]
(c) Comment on the results.

## Question Seven

A rectangular steel bar 0.025 m wide and 0.038 m deep is subjected to a torque of 0.45 kNm . Using the experimentally derived formulae estimate;
(a) the maximum shear stress set up in the material of the bar
(b) the angle of twist
(c) What percentage of error would be involved in each case, (a) and (b), if the approximate equations are used?
$\mathrm{G}=80 \mathrm{GN} / \mathrm{m}^{2}$ for steel

## End of Examination!!!
